Executive Synopsis

Prepared for Staff AI Engineer, Teradata (Job ID 220477), 23 September 2026

I am a Senior AI Engineer with more than five years of experience building AI systems that run in production. At Watad (Navid) in Riyadh I own the architecture of the company's Arabic enterprise RAG platform, and alongside that role I deliver contract work for clients in Saudi Arabia, the UAE, the United States and the United Kingdom. Across that work I have shipped more than 20 production systems.

My path runs from models to platforms. I started as a Data Scientist at COMET Estimating, building ML and document processing pipelines on real construction data. At Aretec I moved into generative AI, delivering a Text to SQL application that lets business users query enterprise databases in plain English. At Watad and with my clients I grew from building features to owning whole platforms: the architecture, security, evaluation, deployment and the engineering standards the team works to.

Selected achievements

- **ByanRAG 2.2.** Designed and led a multi tenant, Arabic first RAG platform with isolated vector collections per organization, five levels of role based access enforced on every endpoint, full audit logging and hybrid retrieval, self hosted on premises for regulated networks and backed by more than 600 automated tests.
- **Mulhem.** Contributed to Mulhem, the first Arabic large language model trained locally in Saudi Arabia.
- **Model quality.** Built the Claude as judge reward and evaluation pipeline behind Yehia R1, which reached first place on the AraGen Leaderboard in the 0.5B to 25B class.
- **ytkb.** Released ytkb as open source under the MIT licence, a command line tool that turns video into a searchable knowledge base in six languages, including Arabic.

What I bring to Teradata is the discipline to take AI from a promising prototype to a secure, observable, well tested platform that an enterprise can rely on every day.
