05 Template 3 — Voice

06 Before you send

1

How to use this pack

Four moves, in order, every time

- 1 Screen the brief first (10 seconds).** If it matches the red list on the next page, do not answer it. Nineteen of your 267 responses went to briefs that were never development projects.
- 2 Pick the template.** WhatsApp agent, clinic front desk, or voice receptionist. If it is none of those three, write from scratch — do not bend a template to fit.
- 3 Edit three things only.** Their name, one sentence naming *their* exact use case in their own words, and one number you can stand behind. Everything else stays as written.
- 4 End with one question.** Never two. A single question doubles reply rates because it costs the buyer five seconds, and their answer tells you whether to quote at all.

Rules that apply to all three

- \$ Never send a range.** The bands in this pack are yours to choose from — the client sees one number. A range tells them to negotiate from the bottom of it.
- 🧱 Lead with the compliance layer, not the chatbot.** Anyone can wire an LLM to a webhook. Official Cloud API, HMAC-verified fail-closed webhooks, deduplication, the 24-hour service window and STOP/START opt-out are what stop the number getting banned — and most competitors cannot name them.
- 🗣️ Do not use your own vocabulary.** Across all 267 briefs, not one client wrote RAG, LLM, vector search, embeddings, self-hosted or Arabic. Say “answers from your own documents”. Say *RAG* once, in the delivery section, after they have agreed.
- 🕒 Speed is already solved.** 86% of these briefs were answered the same day. The gap is not how fast you reply — it is what the reply says. Slower and sharper wins here.

Payment terms — identical across all three

STAGE	SHARE	TRIGGER
Signature	30%	Before work starts
UAT	40%	System passes agreed acceptance tests
Acceptance	30%	Handover, runbook and training delivered

Always included: source code and full ownership, handover documentation and a runbook, named failure modes written down before the build, acceptance against measured numbers rather than demos. Never included unless quoted: cloud spend, third-party licences and API credits, data cleanup, out-of-scope integrations, 24/7 on-call.

2

The 60-second screen

Answer, qualify, or skip — decided from the title alone

	WHAT IT LOOKS LIKE	WHAT TO DO
ANSWER	WhatsApp bot · AI agent · chatbot for [business] · booking or appointment system · clinic reception · AI receptionist · lead qualification · CRM integration · document or PDF assistant	Use a template. 199 of 267 briefs land here.
QUALIFY	Full platform or SaaS build · mobile app · HIPAA/GDPR system · marketplace · “hybrid ecosystem” · anything with no named channel and no named system	Ask budget and timeline <i>before</i> writing scope. Different buyer, different price — never the bot proposal.
SKIP	“Role” or “Specialist” in the title · commission-only · appointment setter · cold caller · partnership or reseller · CAD/CNC · video editing · bulk blasting on unofficial APIs · virtual assistant admin · business plans	Do not respond. 23 briefs were staffing, not projects.

Two leaks worth closing

- **19 responses** went to briefs that were never development work. That is one wasted slot in fourteen.
- 💬 **23 briefs drew 47 responses** because two of your accounts bid on the same job. Pick one account per brief — Fiza_ismail for clinical and medical, Mustafa Shoukat for everything else — and never both.

Bulk WhatsApp blasting — the one to always refuse

Seven briefs asked for mass blasting, multi-account sending or SIM-farm messaging. These run on unofficial APIs, get numbers banned within days, and the client blames the developer. Refusing them in one line is also a sales move: *“I only build on the official Cloud API — blasting tools get your number banned, usually inside a week. If you want volume that survives, the answer is template messaging with opt-in, and I can show you how that works.”* A refusal that teaches them something is still a conversation — and it costs you one line.

3

Template 1 — WhatsApp AI agent

Answers 105 briefs · the core offer

Who it is for: any business that says “WhatsApp bot”, “AI auto-responder”, “WhatsApp Business API” or “chatbot for customer enquiries”. This is the single largest cluster in twelve months of briefs.

PASTE THIS — EDIT ONLY THE BRACKETED PARTS

Hi [name] — I build WhatsApp assistants on the official Meta Cloud API, not on an unofficial wrapper that gets the number banned. For [their business in their words], that means [one sentence: the exact thing they asked for].

What you would have in week one: a working number your customers can message, AI replies drawn from your own content and prices, and a clean handoff to a human the moment the assistant is unsure. I handle Meta business verification, template approval and the 24-hour service-window rules, which is where most of these projects stall.

One question so I can quote properly: which system should the conversation write back to — a CRM, a calendar, or a sheet?

Scope and price

PACKAGE	PRICE	TIME	WHAT THEY GET
Starter	\$1,200 – \$2,500	1 week	One number, one flow, AI replies from their content, human handoff
Business	\$2,500 – \$6,000	2 – 3 weeks	Multi-flow, CRM or calendar write-back, dashboard, opt-in/opt-out handling
Managed	\$600 – \$1,500 / mo	Ongoing	Monitoring, prompt and flow iteration, template renewals, support

Quote one figure, not the band. Starter is the entry that converts — it is also the fastest thing you can point at when the next client asks what you have shipped.

What you need from them

- Meta Business account — verified, or willing to verify
- A phone number not already on WhatsApp consumer
- Their FAQ, price list or catalogue in any format
- The system to write back to, and who owns access
- One named person who can approve copy

Not included unless quoted

- Meta verification disputes and business documents
- Message-template credits and Meta conversation fees
- Writing their FAQ content from nothing
- A second language beyond the agreed one
- Migration off an existing unofficial provider

Qualifying questions · ask one, hold the rest for the call

Which system should the conversation write back to — CRM, calendar or sheet?

Are you already verified on Meta Business, or starting from zero?

Roughly how many messages a day do you expect in month one?

Red flags: they want bulk sending to purchased lists · they already run an unofficial API and want it “fixed” · no verified business entity · the budget named is under \$500 · they ask you to use your own number.

4

Template 2 — Clinic front desk

Answers 49 healthcare briefs · highest repeat niche

Who it is for: dental clinics (10 briefs on their own), medical and mental-health practices, aesthetic and hair clinics. They describe a front desk, not a chatbot: missed calls, no-shows, and the same five questions all day.

PASTE THIS — EDIT ONLY THE BRACKETED PARTS

Hi [name] — clinics lose most enquiries in the gap between a message arriving and someone at the desk being free to answer it. [Their clinic] is asking for [their words: booking / reminders / answering questions], and that is the part I build.

How it works: a patient messages the clinic on WhatsApp, the assistant answers the routine questions from your own price list and policies, offers the slots that are genuinely free in your calendar, books the appointment, and sends the reminder the day before. Anything clinical, unusual or upset goes straight to a human with the conversation attached — never answered by the assistant.

One question before I quote: which system holds your appointments today — [Dentally / Setmore / Google Calendar / something else]?

Scope and price

PACKAGE	PRICE	TIME	WHAT THEY GET
Pilot	\$1,500 – \$2,500	1 week	One clinic, one flow: enquiry answering plus booking request to the desk
Full front desk	\$3,000 – \$6,000	2 – 3 weeks	Calendar write-back, reminders, rescheduling, FAQ, escalation rules, dashboard
Managed	\$600 – \$1,500 / mo	Ongoing	Monitoring, seasonal message updates, added services, support
Extra location	\$800 – \$1,500	Per site	Second branch on the same build — the cheapest upsell in this pack

What you need from them

- The calendar or practice system, and API access to it
- Services, prices and appointment durations
- Opening hours, holidays and per-dentist availability
- Escalation rules — what must always reach a human
- Who signs off on patient-facing wording

Not included unless quoted

- Clinical triage or any medical advice — never automated
- Migrating patient records between systems
- A formal HIPAA/GDPR compliance audit or sign-off
- Payment collection inside the conversation
- Insurance claim or RCM workflows

Say the safety line out loud, early. “The assistant never gives clinical advice. Anything outside opening hours, prices, availability and directions goes to a human with the full conversation attached.” Clinics are buying reassurance as much as automation — and the brief that mentions HIPAA or GDPR is testing whether you raise it before they have to.

Red flags: they want the bot to answer clinical questions · no practice-management system and no intention of getting one · patient data to be exported to a spreadsheet · a US client who wants a signed BAA — that is a legal commitment, not a feature.

5 Template 3 — Voice receptionist

Answers 29 briefs · the 2026 growth curve

Who it is for: clinics, agencies and service businesses that name Retell, Synthflow, Vapi or simply “AI receptionist”. Near zero in 2025, a steady stream from early 2026 — and it sells to the same buyer as Template 2.

⚠️ Quote this one honestly. Your rate card lists voice as *in build, quoted case by case* because there is no recorded production deployment yet — no answer-rate number, no published call recording. So sell a **paid pilot**, never a finished capability. Do not claim delivered voice work until one is live and you can name the numbers.

PASTE THIS — EDIT ONLY THE BRACKETED PARTS

Hi [name] — the honest version first: I build these on [Retell / Synthflow] and I scope them as a paid two-week pilot rather than a fixed build, because voice quality depends entirely on your call patterns and nobody can promise a number before hearing them.

The pilot covers one line and one job — [their words: booking, qualifying, out-of-hours cover]. You get the call flow designed and built, a live number, recordings of every call, and a measured answer and completion rate at the end of week two. If the numbers are good we scale it; if they are not, you have a small bill and a real answer instead of a twelve-thousand-dollar guess.

One question: what happens to those calls today — voicemail, an answering service, or nobody?

Scope and price

PACKAGE	PRICE	TIME	WHAT THEY GET
Call-flow design	\$500 – \$1,500	3 – 5 days	Scripted flows, escalation map, provider choice. Credited against the pilot
Pilot build	\$1,500 – \$4,000	2 weeks	One line, one job, live number, recordings, measured answer and completion rate
Scale-up	Quoted after pilot	—	More lines, CRM write-back, after-hours routing — priced on the pilot's numbers
Managed	\$300 – \$1,200 / mo	Ongoing	Monitoring, prompt tuning, provider costs passed through at cost

What you need from them

- A number to forward, and who controls it
- Ten recordings or transcripts of real calls
- What a successful call means, in one sentence
- Hours, escalation path and after-hours behaviour
- Written consent to record, per their jurisdiction

Not included unless quoted

- Telephony and speech provider costs — passed through
- Number porting and carrier negotiation
- Languages or accents beyond the agreed one
- Outbound cold calling — decline these outright
- Guaranteed answer or booking rates before the pilot

▶ Red flags: outbound cold-call campaigns · “commission only” or revenue-share instead of a fee · a guaranteed conversion rate demanded up front · no access to real call recordings · reseller or white-label partnerships dressed as projects — eight of the 29 voice briefs were partnerships, reseller offers or cold-calling roles rather than builds.

6

✓

Before you send

The last sixty seconds

- ✓ **One number, never a range.** Pick the figure from the band and delete the band.
- ✓ **Their words are in the first two lines.** If your opener could be sent to any other client on the list, it is not finished.
- ✓ **One question at the end.** Count them. If there are two, delete one.
- ✓ **One account per brief.** Clinical and medical from Fiza_ismail, everything else from Mustafa Shoukat. Never both on the same job.
- ✓ **No RAG, no LLM, no vector search, no “self-hosted”.** Zero clients in 267 briefs used those words.
- ✓ **Every number you claim is one you can show.** If you cannot produce the artefact, cut the sentence.

The gap that is costing you the most

These templates are as strong as the proof attached to them, and right now there is no case study with a before-and-after number in any of them. That is the single biggest hole in this pack — the rate card says the same thing. One finished WhatsApp build, written up with a measured result and the client's written permission to name them, would lift the reply rate on all three templates more than any rewording will.

FILL THIS IN	STATUS
One named case study with a measured before/after number	Missing — build it first
Written client permission to name them	Required before any case study goes out
A recorded production voice deployment	Missing — sell pilots until it exists
Years-of-experience figure used across all docs	Check — evidence supports 5+, keep it consistent
Shipped-integration list (Cloud API, Twilio, n8n, GoHighLevel, Calendar)	Real — use it freely

Internal sales pack · prices from the Codagentic rate card (9 Sep 2026, valid 90 days) · demand figures from the Fiverr Briefs Intelligence Report, 267 briefs, Sep 2025 – Sep 2026 · Mustafa AI
